

NobleStride Capital CRM — *what each tab does*

The client wrote the spec for **Twenty CRM**. We built it **bespoke** instead — same six entities, same pipelines, same dashboard, same AI features. The spec still governs **what** it does; only the **how** changed.

7 navigable sections 6 business entities 12 controlled vocabularies

ported from 8 client source files

HOW TO READ THE STATUS FLAGS

What's live vs. what's a demo

This is a “demo-ready foundation” — complete-looking and navigable on realistic data, with the seams for live AI left open. Each section below is flagged honestly.

- **Live** — real data, working create/edit/delete
- **Demo** — present & functional, but canned/heuristic (no LLM yet)
- **Deferred** — placeholder or intentionally out of scope

THE SEVEN SECTIONS · IN NAV ORDER

Tab by tab

The sidebar order — Dashboard, Mandates, Transactions, Investors, Engagement, Partners — mirrors the spec's prescribed navigation (§5). Clients exists as a

seventh section, reached from a client's deals rather than the main nav, exactly as the spec lays out.

01

Dashboard

/dashboard

The executive cockpit — pipeline health and deal velocity at a glance, the first thing the team sees each morning.

ON SCREEN

Four KPI tiles (**Active Mandates**, **Active Transactions**, **Investors Engaged this quarter**, **Capital Raised YTD**) with 30-day deltas; a Deal-Pipeline trend chart (active vs. closed, 6 months); a Pipeline-Overview chart by stage; and the Overview Agent insight card.

MAPS TO SPEC

\$6 Dashboard

STATUS

● stats & charts live

● insights canned

02

Mandates

/mandates

The client-acquisition pipeline — a deal from first lead to a signed engagement agreement. A Kanban board you drag cards across.

ON SCREEN

Kanban board, one column per stage (New Lead → Signed / Lost), **drag-to-restage**; cards show client, sector, next action, days-in-stage, owner. Four counters (Active Leads, In Proposal, Signed, Conversion Rate). Create / edit / delete via drawer; detail page per mandate.

MAPS TO SPEC

\$3 Mandate · **\$4 Mandate Stage** · **\$5 view**

STATUS

● Live + drag-restage

● Find Prospects · filters

03

Transactions

/transactions

The fundraising-execution pipeline — once a mandate is signed, this tracks investor outreach through to close.

ON SCREEN

Kanban (Deal Prep → Closed-Won / Lost), drag-to-restage that auto-stamps the close date. Cards show target raise, investors contacted, active conversations, days-in-stage. Counters incl. **Capital Raising** and **Avg. Time to Close**. The **Match Investors** button lives here — the spec's top-priority AI feature.

MAPS TO SPEC

\$3 Transaction · **\$4 Txn Stage** · **\$5 view**

STATUS

● Live + drag-restage

● Match Investors · filters

04

Investors

/investors

The fund database — the firm's network of PE / VC / DFI / debt investors, segmented and searchable. The spec calls this the largest, highest-value object.

ON SCREEN

Six segment tiles (Total, Active this quarter, and counts by type). **Working** search + filters (type, sector, geography, status) that drive the URL. A table of investor, type, ticket size, sectors, geography, status. Detail page shows criteria, contacts, and engagement history.

MAPS TO SPEC

\$3 Investor · **\$4 (5 vocabs)** · **\$5 view**

STATUS

● Live · filters real

05

Engagement

/engagement

The interaction log — one record per investor approached on a deal, plus a running timeline of every touch. This is what powers “investors contacted” everywhere else.

ON SCREEN

Six interaction-type counters (Outreach, NDA Signed, Data Room, Meetings, Feedback, Term Sheets). Engagements grouped **by deal** with status chips, beside a chronological **activity timeline**. A **Log Engagement** dialog records an interaction and stamps the activity feed in one step.

MAPS TO SPEC

\$3 Engagement (join) · **\$5 view**

STATUS

● Live · logging works

06

Partners

/partners

The referral network — law firms, advisors, and deal sources, with the ROI of what they've referred.

ON SCREEN

Four stat tiles (Total Partners, Deals Referred, Closed Revenue, Conversion Rate). A directory table with per-partner referred / active / closed / revenue rollups, plus a "referrals by partner" bar chart. Create / edit / delete; detail page lists contacts and referred mandates.

MAPS TO SPEC

§3 Partner · §5 view

STATUS

● Live

07

Clients

/clients

The companies NobleStride raises money for — the portfolio. Reached from a mandate or transaction, not the main nav (matching the spec's navigation).

ON SCREEN

Portfolio table (client, sector, HQ city, last-year revenue, mandate count). A rich detail page: company profile, founders, revenue actuals & forecast, existing investors, plus all linked mandates and transactions. Full create / edit / delete.

MAPS TO SPEC

§3 Client · §5 (nav-omitted by design)

STATUS

● Live

THE QUESTION YOUR MANAGER WILL ASK

Is the AI real or a demo?

Honest answer: the AI features **work and run on real data**, but they're deterministic heuristics — not a language model. They were built as a drop-in *seam*: each one is a GraphQL endpoint whose body gets swapped for Lua semantic search later, with the signature unchanged. This is exactly the integration plan in spec §8.

SURFACE

WHAT IT ACTUALLY DOES TODAY

Match Investors	Scores every investor against a deal — 50% sector, 30% geography, 20% ticket fit, +10% if actively deploying. Ranked, transparent, repeatable. The spec's #1 AI priority.	● real scoring · no LLM
Find Prospects	Surfaces other companies in the same sector as a mandate's target. Sector-overlap filter with a templated rationale.	● rule-based
Overview Agent insights	Three live insights on the dashboard: mandates ready to convert, deals with no activity in 14 days, and a top investor match. Computed from the database.	● heuristic
Ask your agents anything	The top-bar box answers pipeline / investor / dashboard questions by keyword-routing to real aggregates. Functional, not conversational.	● keyword + data
Sidebar agent cards	Overview · Prospecting · CRM · Notes — visual placeholders for the future agent roster. No action wired yet.	○ decorative

THE FILES THE CLIENT ACTUALLY HANDED US

Where every requirement came from

The spec wasn't invented — it's a distillation of the firm's own working files: eight password-protected Office documents (their real trackers, intake forms, and a process memo). The data model mirrors their spreadsheet columns almost one-to-one, which is the strongest answer to “does this fit how they actually work?”

End-to-End Onboarding & Fundraising Workflow.docx

The master process memo (Dec 2024, confidential). Four stages: onboarding → document prep → engaging the market → closure. **This is why there are two pipelines** — Mandates cover onboarding to a signed agreement; Transactions cover market engagement to close.

Engagement contract Tracker.xlsx · 914 rows

Client, NDA sent/signed, Engagement-Agreement sent/signed, Lead, Source. **The direct source of the Mandate object** and its NDA / EA tracking fields.

Investor Tracker.xlsx · 869 + 285 rows

Sheet 1 (funds): firm, contacts, geography, sector focus → **Investors** + their contacts. Sheet 2 (law firms): contact, amount, profile, status → **Partners**.

Target companies Data Collector.docx

Intake fields for companies raising capital — founders, revenue, forecast, raise amount, instrument. **The source of the Client object.**

Sectors and Milestones.docx

The full sector taxonomy (Agribusiness, Financial Services, FMCG, Manufacturing, Renewables, Health, Tech...) plus deal milestones. **Feeds the Sector vocabulary** — sub-sectors deferred to v2 per §11.

Tasks Tracker (WhatsApp 2026).xlsx · 384 tasks

A per-person task board for the real 12-person team. **Feeds Task statuses, the Source vocabulary, and the team Member list** (Brenda, Brian, Cliff, Duncan...).

Data collected from potential investors.docx

The full investor-profile field list (mandate, stages, ticket, instruments, target IRR, ESG, IC process). **Feeds the Investor object** — and sketches the future investor portal.

Template to Collect Investor Preferences.docx

A Microsoft-Forms intake template. **The model for the public intake form** the spec recommends (§7) instead of a custom investor login.

SPEC COVERAGE, SECTION BY SECTION

Where the build stands against the 11-section spec

SPEC §	TOPIC	STATUS	HOW IT LANDED IN THE BUILD
§1	Twenty conventions	superseded	N/A — bespoke stack replaces the Twenty setup steps.
§2	Object map	built	Encoded in the Prisma schema & relations.

SPEC §	TOPIC	STATUS	HOW IT LANDED IN THE BUILD
§3	Object schemas	built	All six entities + Person, Task, Activity.
§4	Vocabularies	built	All 12 enums (stages, types, sectors, geographies...).
§5	Views & nav	built	Nav order matches; Kanban boards + tables delivered.
§6	Dashboard	built	Stats + charts live; the bespoke build sidesteps the Twenty SDK-skew that blocked the agent panel.
§7	Roles & portal	deferred	Single demo user; investor portal was out of scope by the client's own recommendation (use an intake form).
§8	Lua AI	seam ready	Four AI endpoints present & canned; drop-in for live Lua, signatures fixed.
§9	Import / cleaning	handled	Replaced by a realistic seed script (full SSA dataset).
§10	Build order	followed	Same sequence, adapted to the bespoke stack.
§11	Out of scope	honored	Portal, sub-sector taxonomy, agent panel deferred as specified.

IF YOU ONLY SAY FIVE THINGS

Your talking points

- 01 We built the client's spec, on a better foundation.** Same entities, vocabularies, pipelines, dashboard and AI features — bespoke Next.js instead of Twenty, so we own the branding and dodge Twenty's blocking SDK bug.
- 02 It's a real, navigable CRM on realistic data** — not clickable mockups. Seven sections, full create / edit / delete, drag-to-restage pipelines, live filtering and engagement logging.
- 03 The AI works but is heuristic today.** Match Investors, Find Prospects, insights and Ask-anything all run on real data with no LLM — deliberately built as a seam to swap in live Lua semantic search (spec §8) without touching the UI.
- 04 Two things are intentionally not built:** live Lua AI (seam in place) and the investor portal (out of scope per the client's own §7 recommendation).
- 05 Next milestone is wiring Lua in.** Because the AI is already a fixed GraphQL contract, going live is a back-end swap, not a rebuild.

METHODOLOGY & SOURCES

Seed dataset behind every screen (idempotent, realistic Sub-Saharan-Africa data):

~13 team users

~40 investors

~15 clients

~20 mandates

~12 transactions

~60 engagements

~10 partners

~120 activities
